

Prehistoric Pets Care Sheet

Peach Throat Monitor (*Varanus jobiensis*)

General Information

Peach throat monitors are found on the island of New Guinea. These lizards are closely related to the blue tail monitor and the mangrove monitor. Each of the three species of these monitor lizards utilizes different habitats in New Guinea. Peach throat monitors prefer dense forests and are excellent climbers. Wild peach throat monitors will typically eat frogs, lizards, insects, and any small animal they can overpower. With proper feeding, peach throats grow quickly and adults can reach 3-4 feet in total length. With proper care peach throat monitors can live 10-15 years in captivity. Like most monitors, peach throats are nervous captives and may take some time to tame down. Ideally, the cage should include multiple hiding spots to provide a sense of security. Prehistoric Pets promotes responsible reptile ownership and we recommend locking cages that prevent accidental escape. Large monitors and other escaped reptiles can have a negative impact on the general public which can lead to a ban of reptile ownership.

Temperature and UV Lighting

Peach throat should be maintained between 85-90 degrees with a basking spot of 95 degrees. At night the temperature can drop to 75 degrees. Hours of daylight should be 12L/12D during a 24 hour period. Humidity should also be maintained at 70%-90%.

UVB lighting is not a must for monitors, but is recommended. UVB lighting enables reptiles to metabolize calcium, by creating Vitamin D3. However, because their diet consists of rodents and other live prey, they can usually receive enough D3 and calcium through their diet. The bones of the prey will provide calcium, while the liver will provide Vitamin D3. Also it is very important to change your UVB light every 6-8 months, after this time the light stops producing adequate UVB. If you're not sure if your UV light is still producing UVB, bring it in and we'll be happy to test the light for you.

Housing

Baby peach throat monitors can be kept in a 29 gallon cage but they grow quickly and will soon need larger housing. Adult peach throat monitors should be kept in a cage that is at least 6' x 2' x 4'.

Bedding

Our recommendation for bedding is bark or coconut bark, this bedding holds moisture very well and duplicates their natural environment.

Food

Peach throat monitors are opportunistic hunters and are known to eat almost anything. Ideal foods are; mice, rats, fish, crawdads, crickets, superworms, nightcrawlers, beef heart, and hard boiled eggs. A mixed diet of these food items, four to five times per week, will ensure proper growth and health.

Calcium

A calcium and vitamin supplement should be put on all food that does not contain bones. When feeding your monitor mice, rats, or fish, no supplement is needed.

Cleaning and Handling

The terrarium should be cleaned as necessary. Any fecal matter or left over food should be cleaned out several times a week. The bedding should be completely changed once a month and fresh clean water should be provided at all times. The inside of the terrarium can be cleaned out with an appropriate reptile cage cleaner, we recommend Natural Chemistry's Healthy Habitat. Peach throat monitors can be handled on a daily basis and always wash your hands before and after handling them.
